The rapid pace at which applications utilizing GPS data is evolving has required a similar rapid development of data handling methods and techniques in support of those applications. The recent and upcoming deployment of several Low Earth Orbiter (LEO) satellites with onboard GPS receivers places new demands on global coverage and data latency within the IGS context. Data handling strategies to meet these demands will be discussed.

Session 12: Issues of data quality management and ~~hardware/software~~ technological problems in GPS

ORAL (preferred)
